1.1 General Description

MMIQ-0626HSM is a high linearity, passive GaAs MMIC IQ mixer. This is an ultra-broadband mixer spanning 6 to 26 GHz on the RF and LO ports with an IF from DC to 6 GHz. Up to 40 dB of image rejection is available due to the excellent phase and amplitude balance of its on-chip LO quadrature hybrid. Both surface QFNs and evaluation boards are available. For a list of recommended LO driver amps for all mixers and IQ mixers, see here.

Pin 10 DC Current	30	mA
Pin 12 DC Current	30	mA
Power Handling, at any Port	+26	dBm
Operating Temperature	-55 to +100	°C
Storage Temperature	-65 to +125	°C

3.2 Package Information

Parameter	Details	Rating
ESD	Human Body Model (HBM), per MIL-STD-750, Method 1020	1A
Weight	EVAL Package	13.4 g

3.3 Recommended Operating Conditions

The Recommended Operating Conditions indicate the limits, inside which the device should be operated, to guarantee the performance given in Electrical Specifications Operating outside these limits may not necessarily cause damage to the device, but the performance may degrade outside the limits of the electrical specifications. For limits, above which damage may occur, see Absolute Maximum Ratings.

	Min	Nominal	Max	Units
T_A, Ambient Temperature	-55	+25	+100	°C
LO drive power	+13	+19	+23	dBm
RF/IF input power			+11	dBm

3.4 Sequencing Requirements

There is no requirement to apply power to the ports in a specific order. However, it is recommended to provide a 50Ω termination to each port before applying power. This is a passive diode mixer that requires no DC bias.

3.5 Electrical Specifications

The electrical specifications apply at T_A=+25°C in a 50Ω system. Typical data shown is for a down conversion application with a +19dBm sine wave LO input.

Min and Max limits apply only to our connectorized units and are guaranteed at T_A=+25°C. All bare die are 100% DC tested and visually inspected.

[2] Measured as an I/Q down converter. (i.e., I and Q powers are not combined)

[3] Mixer Noise Figure typically measures within 0.5 dB of conversion loss for IF frequencies greater than 5 MHz.

[4] Image Rejection and Single sideband performance plots are defined by the upper sideband (USB) or lower sideband (LSB) with respect to the LO signal. Plots are defined by which sideband is selected by the external IF quadrature hybrid.

[5] Amplitude and phase balance measured in a down conversion.

[6] Typical IIP3 measured with I and Q ports combined with an external quadrature hybrid coupler in a down conversion.

[7] I output means that the IF output signal is measured at the I port of the mixer and the Q port is loaded. Q output means the IF output signal is measured at the Q port of the mixer while the I port is loaded.

[8] I+Q measurements taken with an external quadrature hybrid attached to the I and Q ports of the mixer. Orientation depends on up conversion or down conversion measurement.

3.6.1 Typical Spurious Performance: Down-Conversion

Typical spurious data is provided by selecting RF and LO frequencies (± m*LO ± n*RF) within the RF/LO bands, to create a spurious output within the IF band. The mixer is swept across the full spurious band and the mean is calculated. The numbers shown in the table below are for a -10 dBm RF input. Spurious suppression is scaled for different RF power levels by (n-1), where "n" is the RF spur order. For example, the 2RF x 2LO spur is 80 dBc for a -10 dBm input, so a -20 dBm RF input creates a spur that is (2-1) x (-10 dB) lower, or 90 dBc isolation.

Typical Down-conversion spurious suppression (dBc): Q Port (I Port)

-10 dBm RF Input	0xLO	1xLO	2xLO	3xLO	4xLO	5xLO
0xRF	-	49 (50)	60 (60)	57 (56)	74 (75)	N/A
1xRF	33 (39)	Reference	47 (36)	60 (52)	51 (60)	N/A
2xRF	73 (77)	54 (56)	80 (74)	63 (64)	79 (77)	78 (70)
3xRF	96 (95)	69 (69)	83 (86)	79 (81)	99 (99)	72 (74)
4xRF	131 (131)	103 (109)	119 (120)	100 (110)	122 (121)	115 (115)
5xRF	N/A	N/A	135 (137)	131 (131)	126 (134)	131 (133)

3.6.6 Typical Spurious Performance: Up-Conversion

Typical spurious data is taken by mixing an input within the IF band, with LO frequencies (± m*LO ± n*IF), to create a spurious output within the RF output band. The mixer is swept across the full spurious output band and the mean is calculated. The numbers shown in the table below are for a -10 dBm IF input. Spurious suppression is scaled for different IF input power levels by (n-1), where "n" is the IF spur order. For example, the 2IFx1LO spur is typically 41 dBc for a -10 dBm input with a sine-wave LO, so a -20 dBm IF input creates a spur that is (2-1) x (-10 dB) lower, or 51 dBc.

-10 dBm IF Input	0xLO	1xLO	2xLO	3xLO	4xLO	5xLO
0xIF	-	39 (44)	59 (59)	67 (67)	66 (66)	N/A
1xIF	33 (39)	Reference	36 (33)	22 (26)	58 (49)	N/A
2xIF	54 (55)	41 (41)	65 (66)	64 (56)	100 (101)	89 (75)
3xIF	88 (85)	54 (55)	83 (84)	66 (59)	101 (91)	90 (84)
4xIF	112 (113)	84 (84)	103 (107)	95 (89)	110 (106)	121 (104)
5xIF	131 (132)	108 (109)	128 (129)	104 (103)	126 (127)	125 (110)
